RedLines Pro

Quantified, decision-grade climate risk insight

Integrated physical and transition risk analysis to inform investment, resilience and financial planning decisions.

Why Pro is Needed

Many organisations lack a quantified view of climate risk exposure.

Exposure alone does not determine financial materiality or support capital allocation decisions. When investment planning, insurance renewal or governance scrutiny require defensible financial inputs, qualitative risk signals are insufficient.

Before committing capital or reporting material risk, organisations need clarity: what is the potential financial impact, under which scenarios, and over what timeframe?

Pro provides that quantified insight, enabling informed financial decisions.

It draws on RedLines' integrated physical and transition risk framework.

What Pro Enables

📊 Quantified financial exposure under defined scenarios

⤴ Comparative scenario analysis across time horizons

📍 Asset-level impact modelling

👑 Executive-ready reporting for board and insurer engagement

What Pro Is Designed to Do

RedLines Pro is a structured financial risk assessment designed to quantify climate-related exposure at asset and portfolio level.

It models potential financial impact under defined climate scenarios, integrating physical and transition risk signals to support investment and resilience planning. Ongoing monitoring and multi-entity deployment are addressed within Expert.

Pro informs capital allocation, insurance strategy and financial governance decisions. It does not replace strategic adaptation design.

How Pro Fits

### Scan

Baseline exposure visibility

Pro

Quantified, decision-grade insight

Expert

Scaled, multi-entity capability
